

**The Suwannee River Watershed (Georgia-Florida border):** The Suwannee River is a center for southeastern coastal plain riparian forest buffer research and demonstration. The main approaches for stream corridor restoration and protection in the watershed are riparian forest buffer restoration on agricultural lands in the headwaters areas and land acquisition along main channels in the downstream areas. Forest buffer projects on the Suwannee’s agricultural lands involve demonstration, research, and monitoring of the effects of restoration and management efforts.

*The 12 restoration showcase watersheds were selected for their use of stream corridor restoration technology to improve the community, the environment, and water quality as endorsed in the Clean Water Action Plan. They represent a variety of geographic locations and conditions, a balance of management practice and technical design, strong local, tribal or state leadership, and partnership in stream corridor restoration. [see <http://www.epa.gov/owow/showcase/>]*
